

SEC-PROC-INC-001 - Security Incident Triage Runbook (APPROVED)

Synthetic training document. Not for operational use.

Document ID: SEC-PROC-INC-001 | Version 1.0 | Status: APPROVED | Effective: 2025-11-15 |
Owner: Plant Cyber Security

1. Triage questions

- 1 Which asset or gateway is affected, and how critical is it?
- 2 Is the traffic pattern consistent with a known benign cause (maintenance window, vendor task, typing errors)?
- 3 Is there an operational signal at the same time (abnormal sensor behaviour, control change)?

2. Severity guide

- Low: single indicator, no operational signal.
- Medium: two indicators or one indicator on a Critical or High asset.
- High: confirmed unauthorised access or change, or any indicator with an operational signal.

3. Actions and limits

Triage may recommend containment steps. Isolating an asset, blocking an address or stopping a process is decided and executed by the on-duty security lead together with the operations shift supervisor. An automated tool or model output is never the approval.

A false positive is recorded with the reason so the detection rules can be tuned.
